(54) Title: SURGICAL DRAPING SYSTEM

(57) Abstract: A surgical draping system (2), separates the sterile surgical field from the unsterile surgical table and isolates the patient so that sterile surgical procedures can be performed without chance of contamination. The components of the surgical draping system are provided folded and in sterile condition inside a sealed bag container. The sealed bag (4), is placed across an operating table (8), prior to placement of the patient. Once the patient has been positioned on the operating table (8), the bag (4), is opened and the surgical drape (10) is extended. The draping system may include coverings for legs or arms and a top drape. The draping system isolates the operating field in a simple and sterile manner and can be discarded at the termination of the procedure.
